

# 1 axioms

## 1.1 euclid's axioms

1. There is one line through any two distinct points.
2. There is one line containing any nondegenerate line segment.
3. For any point  $p \in \mathbb{R}^2$  and any radius  $r \in \mathbb{R}$ , there is exactly one circle with center  $p$  and radius  $r$ .
4. All right angles are equal.
5. Suppose two lines cross an axis. If, on one side of the axis, the interior angles sum to under  $\pi/2$ , then the lines cross on that side.

Figure 1.1:  $\alpha + \beta < \pi/2$

Definition 1.1.1 (parallel postulate) For a line  $L$  and point  $p \notin L$ , there is one line through  $p$  parallel to  $L$ .

This ensures we are studying the Euclidean plane, *i.e.*  $\mathbb{R}^2$ .

## 1.2 constructions

Theorem 1.2.1 Every line segment is the leg of some equilateral triangle.

Proof. Start with the line segment:
