1 Taylor series

and for some $x^* : (x_0, x)$,

Lemma 1.1 (mean value theorem: integration) If $f:[a,b]\to_{\mathsf{top}}\mathbb{R}$ and $\varphi:[a,b]\to_{\mathsf{top}}[0,\infty)$ then there is some x:[a,b] s.t.

$$\int_{a}^{b} f(t)\phi(t) = f(x) \int_{a}^{b} \phi(t)dt$$

Proof . Consider the case where $\int_a^b \varphi = 1$. Then it suffices to show for some x : [a, b], we

[Wik15b]

have $f(x) = \mathbb{E}(f; d\varphi)$. By compactness, we can find some $x_{max} : [a, b]$ maximizing f and $x_{min} : [a, b]$ minimizing f. As $\mathbb{E}(f; d\varphi) : [f(x_{min}), f(x_{max})]$, connectedness gives the desired x. \Box Definition 1.2 (Taylor polynomial) Given $f : C^N(\mathbb{R}; \mathbb{R})$, define its N-degree Taylor

polynomial centered at x_0 as $\frac{N}{(x-x_0)^n}$

$$\mathsf{taylor}^{\mathsf{N}}_{\mathsf{x}_0}\mathsf{f}(\mathsf{x}) \coloneqq \sum_{\mathsf{n}=\mathsf{0}}^{\mathsf{N}} \mathsf{D}^{\mathsf{n}}\mathsf{f}(\mathsf{x}_\mathsf{0}) \frac{(\mathsf{x}-\mathsf{x}_\mathsf{0})^{\mathsf{n}}}{\mathsf{n}!}$$

Theorem 1.3 (Taylor's theorem: Lagrange remainder) For $f\colon C^{N+1}(\mathbb{R};\mathbb{R}),$ $f(x)=\text{taylor}^Nf(x)+\frac{1}{N!}\int_{-\infty}^x\,D^{N+1}f(t)(x-t)^Ndt$

 $f(x) = taylor^{N} f(x) + D^{N+1} f(x^{*}) \frac{(x - x^{*})^{N+1}}{(N+1)!}$

Proof. Suppose
$$f:C^{N+1}(\mathbb{R};\mathbb{R})$$
. By the fundamental theorem of calculus,
$$f(x)=f(x_0)+\int_{x_0}^x Df(t)dt=f(x_0)+\int_{x_0}^x \underbrace{D^1f(t)}_{x_0}\underbrace{(x-t)^0dt}$$

Then $du = D^2 f(t)$ and v = -(x - t). Integrating by parts gives

$$f(x) = f(x_0) - Df(t)(x - t) \Big|_{t=x_0}^{x} + \int_{x_0}^{x} D^2 f(t)(x - t) dt$$

$$= f(x_0) + Df(x_0)(x - x_0) + \int_{x_0}^{x} \underbrace{D^2 f(t)}_{u} \underbrace{(x - t) dt}_{dv}$$

$$= f(x_0) + \dots + Df(x_0) \underbrace{\frac{(x - x_0)^{n-1}}{(n-1)!}}_{(n-1)!} + \underbrace{\frac{1}{(n-1)!}}_{x_0} \underbrace{D^n f(t)}_{x_0} \underbrace{(x - t)^{n-1} dt}_{(n-1)}$$

$$= \sum_{n=0}^{N} D_{n}^{n} f(x_{0}) \frac{(x-x_{0})^{n}}{1 + 1} + \frac{1}{n} \int_{0}^{x} D_{n}^{N+1} f(t) (x-t)^{N} dt$$

$$f(x) = \sum_{n=0}^{N} D^{n} f(x_{0}) \frac{(x - x_{0})^{n}}{n!} + \frac{1}{N!} \int_{x_{0}}^{x} D^{N+1} f(t) (x - t)^{N} dt$$

The x^* is given by mean value theorem: integration.

Corollary 1.4 (Cauchy's formula for repeated integration)

[Wik15a]

 $D^{-n}f(x) = \frac{1}{(n-1)!} \int_{x}^{x} f(t)(x-t)^{n-1} dt$

Corollary 1.5 (Taylor's theorem: no remainder) For
$$f: C^N(\mathbb{R}; \mathbb{R})$$
,
$$f(x_0 + h) = \mathsf{taylor}^N f(x_0 + h) + o(h^N)$$

Proof. By Taylor's theorem: Lagrange remainder,

$$f(x_0+h) = \mathsf{taylor}^{N-1} f(x_0+h) + D^N f(x^*) \frac{(x^*-x_0)^N}{N!} \label{eq:formula}$$

Suppose h is infinitesimal. Then $x^* = x_0 + h^*$, where $h^* : [0, h]$. By continuity,

$$D^N f(x_0 + h^*) \frac{(h^*)^N}{N!} = D^N f(x_0) \frac{(h^*)^N}{N!} + O(h^*) \frac{(h^*)^N}{N!}$$
 So

 $D^{N}f(x^{*}) = D^{N}f(x_{0}) + O(h^{N+1})$

2 Analytic functions

as r < 1.

Definition 2.1 A function $f: C^{\infty}(\mathbb{R}; \mathbb{R})$ is analytic in an open interval (a, b) iff f|(a, b) =taylor $^{\infty}f|(a,b)$. The function is analytic on \mathbb{R} iff for each $x:\mathbb{R}$, there is some open interval containing x on which f is analytic. The space of analytic functions is denoted $C^{\omega}(\mathbb{R};\mathbb{R})$.

Definition 2.2 A function in $C^{\omega}(\mathbb{C};\mathbb{C})$ is called entire.

Lemma 2.3 (ratio test) Let
$$a_n : \mathbb{C}$$
 be a sequence. If

where $a_n = |a_n| : [0, \infty)$. Suppose eq. (1) holds. Let

$$\lim_{n\to\infty}\left|\frac{a_{n+1}}{a_n}\right|<1$$

$$\left|\frac{a_{n+1}}{a_n}\right| < 1$$

then
$$\sum_{n=0}^{\infty} a_n$$
 converges absolutely. [Wik15d]

then
$$\sum_{n=0}^{\infty} a_n$$
 converges absolutely. [Wik15d]
Proof. (Adapted from [Wik15d]) For absolute convergence, it suffices to consider the case

 $r :\equiv \lim_{n \to \infty} \frac{\frac{a_{n+1}}{a_n} + 1}{2} < 1$

 $\sum_{n=N}^{\infty} a_n \le \sum_{n=N}^{\infty} r^{n-N} a_N \to 0$

(1)

Definition 2.4 (exp) Let

$$\exp(x) := \sum_{n=0}^{\infty} \frac{x^n}{n!}$$

By ratio test

$$\left| \frac{x^{n+1}}{(n+1)!} \frac{n!}{x^n} \right| = \left| \frac{x}{n+1} \right| \to 0$$

Hence $\exp: \mathbb{C} \to \mathbb{C}$ is well-defined and entire.

$$\exp(x+y) = \exp(x)\exp(y)$$

Proof.

$$\begin{split} \exp(x+y) &= \sum_{n=0}^{\infty} \frac{(x+y)^n}{n!} = \sum_{n=0}^{\infty} \sum_{k=1}^n \binom{n}{k} \frac{x^{n-k}y^k}{n!} \\ &= \sum_{n=0}^{\infty} \sum_{k=1}^n \frac{x^{n-k}y^k}{(n-k)!k!} \\ \exp(x) \exp(y) &= \left(\sum_{n=0}^{\infty} \frac{x^{\alpha}}{\alpha!}\right) \left(\sum_{k=0}^{\infty} \frac{y^{\beta}}{\beta!}\right) = \sum_{n=0}^{\infty} \sum_{k=0}^{\infty} \frac{x^{\alpha}}{\alpha!} \frac{y^{\beta}}{\beta!} \end{split}$$

Corollary 2.6 $\exp(xn) = [\exp(x)]^n$

with equivalence given by setting $\alpha = n - k$ and $\beta = k$.

$$\operatorname{corollary} \ 2.0 \ \operatorname{exp}(\operatorname{kit}) = [\operatorname{exp}(\operatorname{k})]$$

Lemma 2.7
$$(\exp(it))^* = \exp(-it)$$

Proof.

$$\exp(it) = \sum_{n=0}^{\infty} \frac{(it)^{2n}}{(2n)!} + \frac{(it)^{2n+1}}{(2n+1)!}$$
$$= \sum_{n=0}^{\infty} \frac{(-1)^n (t)^{2n}}{(2n)!} + i \frac{(-1)^n (t)^{2n+1}}{(2n+1)!}$$

$$\exp(-it) = \sum_{n=0}^{\infty} \frac{(-1)^n t^{2n}}{(2n)!} - i \frac{(-1)^n t^{2n+1}}{(2n+1)!}$$

Theorem 2.8 (Euler's theorem) The map $\exp(i-): \mathbb{R} \to \mathbb{C}$ is a universal covering map of the unit circle. In particular, exp(it) is the point on the unit circle t radians counterclockwise from 1.

Proof. As $|\exp(it)| = \exp(it) \exp(-it) = 1$, its image is contained in $S = \{z : |z| = 1\}$. Note $D \exp(it) = i \exp(it)$, so $\exp(it)$ moves clockwise. Finally, consider arc length.

$$s(t) = \int_{0}^{t} |D \exp(it)| dt = \int_{0}^{t} |i \exp(it)| dt = \int_{0}^{t} dt = t$$

ic trig)
$$\sinh(z) = \frac{e^z - e^{-z}}{2}$$

Example 2.9 (hyperbolic trig)
$$a^{z} = a^{-z}$$

 $\cosh(z) = \frac{e^z + e^{-z}}{2}$

They are entire.

So

Example 2.10 (trig)

They are entire. Note that for $x : \mathbb{R}$,

theorem guarantees its existence.

Theorem 2.12 The map ln(x) is analytic on (0,2).

Proof. By the inverse function theorem,

$$s(t) = \int_{0} |D \exp(it)| dt = \int_{0} |i \exp(it)| dt = \int_{0} dt = t$$

$$s(t) = \int_0^t |D\exp(it)| dt = \int_0^t |i\exp(it)| dt = \int_0^t dt = t$$

 $\tanh(z) = \frac{\sinh(z)}{\cosh(z)} = \frac{e^z - e^{-z}}{e^z + e^{-z}}$

 $\sin(z) = -i \sinh(iz)$ $\cos(z) = \cosh(iz)$

 $\sin(x) = \Re \exp(ix)$ $\cos(x) = \Im \exp(ix)$

Definition 2.11 (ln) Let $\ln:[0,\infty)\to_{\mathsf{top}}\mathbb{R}$ be the inverse of exp. The inverse function

 $D^{n} \ln(x) = (-1)^{n+1} (n-1)! x^{-n}$

 $\mathsf{taylor}_1^\infty \ln(x) = \sum_{n=0}^{\infty} (-1)^{n+1} \frac{(x-1)^n}{n}$

4

 $D \ln(x) = x^{-1}$ $D^2 \ln(x) = -x^{-2}$

 $\tan(z) = \frac{\sin z}{\cos z}$

to the D exp(it) = i exp(it), so exp(it) moves clockwise. Finally, consider arc length.
$$s(t) = \int_0^t |D \exp(it)| dt = \int_0^t |i \exp(it)| dt = \int_0^t dt = t$$

e D exp(it) = i exp(it), so exp(it) moves clockwise. Finally, consider arc length.
$$s(t) = \int_{0}^{t} |D \exp(it)| dt = \int_{0}^{t} |i \exp(it)| dt = \int_{0}^{t} dt = t$$

when x : (0, 2).

Proof.

so taylor $_1^{\infty} \ln(x)$ converges for x : (0, 2).

Corollary 2.13 The map \sqrt{x} is analytic on (0,2).

 $|\ln(x) - \mathsf{taylor}_1^n \ln(x)| = \left| \frac{\mathsf{t}^{-n-1} (x-\mathsf{t})^{n+1}}{n+1} \right|$

By Taylor's theorem: Lagrange remainder, for some t between 1 and x,
$$\ln(x) - \mathsf{taylor}_1^n \ln(x) = \frac{(-1)^{n+1} t^{-n-1} (x-t)^{n+1}}{n+1}$$

 $\leq \left|\frac{\max(1,x^{-n-1})(x-1)^{n+1}}{n+1}\right| \to 0$

(3)

$$D(x)^{1/2} = \frac{1}{2}x^{-1/2}$$

 $\sqrt{x} = \sqrt{\exp \ln x} = \exp \left(\frac{1}{2} \ln x\right)$

$$D^{n}(x)^{1/2} = (-1)^{n} \frac{(2n-1)!!x^{1/2-n}}{(1-2n)2^{n}}$$

 $D^{2}(x)^{1/2} = -\frac{1}{4}x^{-3/2}$

$$\mathsf{taylor}_1^\infty \sqrt{x} = \sum_{i=1}^\infty \frac{(-1)^n (2n-1)!! (x-1)^n}{(1-2n)2^n n!}$$

 $(2n-1)!! = \frac{(2n)!}{2n-1}$

Proof. Base case: n = 1. Note 1!! = 1. Likewise, note 2!/2 = 1. Hence eq. (3) holds for

 $\frac{(2n+2)!}{2^{n+1}(n+1)!} = \frac{(2n+2)(2n+1)(2n)!}{2(2^n)(n+1)n!} = (2n+1)n!!$

5

Suppose for the sake of induction that eq. (3) holds. Note (2n+1)!! = (2n+1)(2n-1)!!.

Consider

Lemma 2.15 (double factorial)

- But ratio test gives

Corollary 2.16

$$\mathsf{taylor}_1^{\infty} \sqrt{x} = \sum_{n=1}^{\infty} \frac{(-1)^n (2n)! (x-1)^n}{(1-2n)(n!)^2 (4^n)}$$

as in [Wik15e].

3 Power series

Theorem 3.1 (radius of convergence) Let P be a power series, $a : \mathbb{C}$. If P(a) converges,

then for all $z : \mathbb{C}$ such that |z| < |a|, we have P(z) converges absolutely [Nee12].

Proof. Let
$$P(z) = c$$
 converges. Then $c_n c$

Proof. Let
$$P(z) = c_0$$

then for all
$$z:\mathbb{C}$$
 such that $|z|<|\alpha|$, we have $P(z)$ converges absolutely [Nee12].
 Proof. Let $P(z)=c_0+c_1z^1+c_2z^2\dots$ By hypothesis, $P(\alpha)=c_0+c_1\alpha+c_2\alpha^2+\dots$

Proof. Let
$$P(z) = c_0$$
 converges. Then $c_n a^n$

Proof. Let
$$P(z) = c_0$$
 converges. Then $c_n a^n |z| < |a|$, thus $|z|/|a| < |a|$

converges. Then
$$c_n a^n \to 0$$
, so we can find some M such that $|c_n a^n| \le M$ for all n. For $|z| < |a|$, thus $|z|/|a| < 1$,

$$\langle |\mathbf{u}|, \max_{|\mathcal{L}|/|\mathbf{u}|} \langle 1 \rangle$$

$$\sum_{i=1}^{\infty} |c_{i}|^{2}$$

$$|z| < |a|$$
, thus $|z|/|a| < \infty$

$$\sum_{n=N}^{\infty} |c_n z^n| = \sum_{n=N}^{\infty} |c_n| |a|^n \frac{|z|^n}{|a|^n} \le M \sum_{n=N}^{\infty} \frac{|z|^n}{|a|^n} = \frac{M \frac{|z|^N}{|a|^N}}{1 - \frac{|z|}{|a|}} \to 0$$

$$\sum_{n=N}^{\infty} |c_n z|$$

$$\sum_{n=N} |c_n z|$$
Hence P(z) converges

- Hence P(z) converges absolutely. [Nee12].
- Corollary 3.2 If P(a) diverges, then P(z) diverges for all $z : \mathbb{C}$ such that |z| > |d| [Nee12].
- Theorem 3.3 (identity theorem) Let $z_n:\mathbb{C}$ be a sequence such that $z_n\to 0$. Let P and Q be power series. If $P(z_n) = Q(z_n)$, then P = Q. [Nee12].
- Proof. Let $P(z) = a_0 + a_1 z + a_2 z^2 \dots$ and $Q(z) = b_0 + b_1 z + b_2 z^n \dots$
- $P(z_n) = a_0 + a_1 z_n + a_2 z_n^2 = b_0 + b_1 z_n + b_2 z_n^2 \cdots = Q(z_n)$ Then as $\lim P(z_n) = \lim Q(z_n)$, we have $a_0 = b_0$. Hence by eq. (4), we get
 - $a_1z_n + a_2z_n^2 \dots = b_1z + b_2z_n^2 \dots$

$$a_1 + a_2 z_n^1 + a_3 z^2 \dots = b_1 + b_2 z_n^1 + b_3 z_n^2 \dots$$

Taking a limit gives $a_1 = b_1$. Repeating this inductively gives P = Q.

- 4 Non-analytic smooth functions
- Counter example 4.1

$$f(x) := \begin{cases} \exp(-x^{-1}), & x > 0 \\ 0, & x \le 0 \end{cases}$$

(4)

Smoothness follows from noting

$$\begin{split} D^{n}f(0) &= \lim_{x \to 0} \frac{f(x)}{x^{n}} = \frac{\exp(-x^{-1})}{x^{n}} = \lim_{x \to 0} \frac{x^{-n}}{\exp(x^{-1})} \\ &= \lim_{x \to 0} \frac{x^{-n}}{1 + x^{-1} + x^{-2}/2 + \dots + x^{-n}/n! \dots} = 0 \end{split}$$

with,

$$\mathsf{taylor}_0^\infty \mathsf{f}(\mathsf{x}) = \mathsf{0}$$

hence f is not analytic at 0. [Wik15c]
